One of the following statements is not related to interleaved memory:

اختر أحد الخيارات

- A number of chips can be grouped together to form a *memory bank*.
- Interleaved memory is just a bank of read only memory
- A system with *K* banks can service *K* requests simultaneously
- Main memory is composed of a collection of DRAM memory chips.

The third computer generation started using:

Select one:

- Transistors
- None of the above
- Printed circuit boards
- Integrates circuits

D

In virtual memory:

Select one:

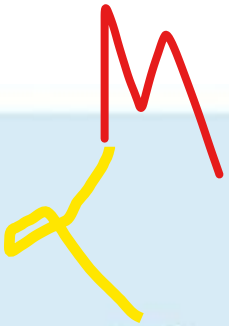

- parts of user programs are kept in external storage devices
- parts of user programs are stored in main memory and other parts in cache
- User programs are kept in external storage devices
- Parts of user program are stored in processor registers and other parts in main memory.

Next page

when cache memory is used in computer architecture:

Select one:

- part of the operating system is loaded in the cache
- some blocks of main memory is copied in the cache
- cache is used to store only some of program code
- part of user program is stored in cache while other part will be in main memory

Next page

to solve the problem of decreasing bus performance due to connecting large number of components is:

Select one:

C

- Increase number of control signals
- Increase the clock speed.
- Use multiple buses, generally laid out in a hierarchy
- Eliminating the slow component

Next page

Step of computer which performs action given in instruction is called

Select one:

- decode
- fetch
- execute
- calculate

Execute

The virtual address is:

Select one:

- The address created by the CPU
- The address related to real memory
- The address in hard disk drive
- The address related to I/O ports

B

Next page

one of the advantages of split cache is:

A

Select one:

- Eliminates cache contention between instruction fetch/decode unit and execution unit
- Higher hit rate
- Balances load of instruction and data fetches automatically
- Only one cache needs to be designed and implemented

M

Next page

In a computer, RAM stands for

Select one:

- remember all memory
- Read And Write memory
- read and more memory
- readily available memory

B

Next page

Computer component which is fastest is:

Select one:

- hard disk
- RAM
- register
- cache

Register

In interrupt-driven I/O:

A

Select one:

- Processor issues an I/O command, continues to execute other instructions, the I/O module informs it that it has completed its work
- Processor executes a program that gives it direct control of the I/O operation
- If the processor is faster than the I/O module this is wasteful of processor time
- The I/O module and main memory exchange data directly without processor involvement

Next page

A computer architecture that includes a DMA:

Select one:

- All of the given choices are true
- Data is transferred between processor and I/O directly
- The CPU can read or write data from or to memory directly
- Data transferred between I/O and memory directly

D

Next page

Memory cycle time is:

Select one:

C

- The time it takes to perform a read or write operation
- Access time for random memory
- The access time plus any additional time required before a second access can commence
- Time latency.

Finish attempt ...

Use of interrupt in computer organization results in:

C

Select one:

- Long wait to serve interrupt
- Decreases the CPU performance
- Short wait when successive I/O operations are needed with slow devices
- Long wait when successive I/O operations are needed with slow devices

Next page

One of the most recently solutions to overcome the difficulties involved in shared bus systems due to higher data rates is:

Select one:

- Use asynchronous transmission
- Point-to-point interconnection
- Use DMA

B

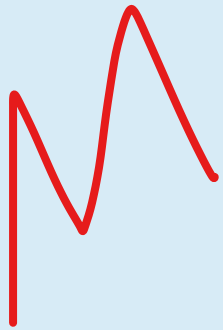

computer resources are controlled by:

Select one:

- cpu
- memory management unit
- operating system
- the DMA unit

C

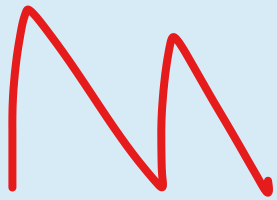

Multi programming requires:

Select one:

Select one:

- Virtual addresses
- Not any of the given choices
- Addresses created by MMU
- Physical addresses

Next page

The third computer generation started using:

Select one:

- Transistors
- None of the above
- Printed circuit boards
- Integrates circuits

1. one of the following services is not of operating system services:

Select one:

- Fitch instruction
- Program execution
- Access to I/O devices
- Program creation

In a computer, RAM stands for

Select one:

- remember all memory
- Read And Write memory
- read and more memory
- readily available memory

Next page

One of the most recently solutions to overcome the difficulties involved in shared bus systems due to higher data rates is:

Select one:

- Use asynchronous transmission
- Point-to-point interconnection
- Use DMA

when cache memory is used in computer architecture:

Select one:

- part of the operating system is loaded in the cache
- some blocks of main memory is copied in the cache
- cache is used to store only some of program code
- part of user program is stored in cache while other part will be in main memory

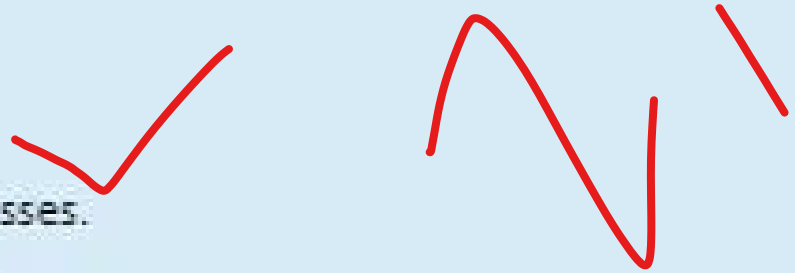

Next page

one of the following does not correct related to set associative mapping:

Select one:

- Each set contains a number of lines
- Cache consists of a number of sets
- Logical addresses are same as physical addresses.
- A given block maps to any line in a given set

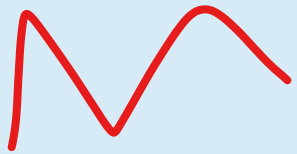

Next page

From following which is not considered to be a computer peripheral device:

Select one:

- keyboard
- CPU
- monitor
- disk drive

Next page

Memory cycle time is:

Select one:

- The time it takes to perform a read or write operation
- Access time for random memory
- The access time plus any additional time required before a second access can commence
- Time latency.

Finish attempt ...

The virtual address is:

Select one:

- The address created by the CPU
- The address related to real memory
- The address in hard disk drive
- The address related to I/O ports

Next page

On-chip cache:

Select one:

- decreases main memory size
- Increases access time
- speeds up execution times
- Increases hit ratio

Next page

to solve the problem of decreasing bus performance due to connecting large number of components is:

Select one:

- Increase number of control signals
- Increase the clock speed.
- Use multiple buses, generally laid out in a hierarchy
- Eliminating the slow component

علّم هذا السؤال

one of the following does not correct :related to set associative mapping

اختر أحد الخيارات

- Each set contains a number of lines
- Cache consists of a number of sets
- A given block maps to any line in a given set
- Logical addresses are same as .physical addresses
