Data Cleaning - Inconsistent Data Entry

```
import pandas as pd
import numpy as np
# read in all our data
suicide_attacks = pd.read_csv("C:\\datasets_719_8659_PakistanSuicideAttacks Ver 11 (30-November-2017).csv", encoding='Windows-1252')
# get all the unique values in the 'City' column
cities = suicide_attacks['City'].unique()
# sort them alphabetically and then take a closer look
cities.sort()
print (cities)
print (cities.shape)
```

Inconsistencies in capitalizations and trailing white spaces are very common in text data.

```
# convert to lower case
suicide_attacks['City'] = suicide_attacks['City'].str.lower()

cities = suicide_attacks['City'].unique()
cities.sort()
```

```
print (cities)
print (cities.shape)

# remove trailing white spaces
suicide_attacks['City'] = suicide_attacks['City'].str.strip()
cities = suicide_attacks['City'].unique()
cities.sort()
print (cities)
print (cities.shape)
```
